

The importance of this "Maxwell Relation" is that it relates various derivatives to experimental observables. For instance (2T/2V)s is the change in temperature per change in volume, when no heat leaves the system. It is readily measured. - (2p/2s), is hard to interpret and measure. · Each thermodynamic function U, H, F, G leads to a maxwell relation For example dF = - SdT - pdV Comparing the cross derivatives $\begin{array}{c} -\left(\frac{\partial S}{\partial V}\right)_{T} = -\left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial S}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial V}\right)_{T} = \left(\frac{\partial P}{\partial T}\right)_{V} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T} & \leftarrow & \text{We will use} \\ \hline \left(\frac{\partial P}{\partial T}\right)_{T}$ A table of the Maxwell Relations is given on the slide below.

Maxwell Relations

We derived this first from the Energy, E(S, V)

Enthalpy, H(S, p)

We derived this next from the Free Energy, F(T, V)

Gibbs Free Energy G(T, P)

Example: Using Maxwell Relations

· Suppose you want to know the entropy of a substance as a function of temperature and volume. You can measure the specific heats (, (T, V) and the pressure p(T, V) First keep the volume fixed $TdS = dQ = C_V dT$ " So at fixed volume we can integrate to find S: $\begin{pmatrix} \partial S \\ \partial \overline{T} \end{pmatrix}_{V} = \frac{C_{V}}{\overline{T}} \qquad \Delta S = \int C_{V}(\overline{T}, V) dT \\ \overline{T} = \int C_{V}(\overline{T}, V) dT$ · Now consider temperature and volume changes $dS = \begin{pmatrix} \partial S \\ \partial T \end{pmatrix}_{T} dT + \begin{pmatrix} \partial S \\ \partial V \end{pmatrix}_{T} dV$ Use maxwell Relation! $dS = C_V dT + (\frac{\partial \rho}{\partial f})_V dV V$ So at fixed temperature State

So by using Maxwell Relations we are able to relate all thermodynamic derivatives, e.g. (25/2V) in this example, to measurable quantifies such as the pressure. This is the general result. All physical results are related to specific heats and the pressure through maxwell relations. For an ideal gas Equation of State we have p=NKT/V and $\Delta S = \int \frac{Nk}{V} \frac{dV}{V} = \frac{Nk}{\sqrt{V_1}} \frac{V_2}{\sqrt{V_1}}$
